DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 1-7, 9, 12-14, 16-17, 20-22, and 24-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Walker et al [6,199,014] in view of Kepler [6,477,460].

Walker et al discloses a system for providing driving directions and visual cues. According to Walker et al, the navigation system comprises a vehicle-based telematics system (e.g., 102), figure 3), a vehicle-based global positioning system operable to determine a geographic position of the vehicle (column 1) and a control (e.g., 101), wherein the telematics system (102) being operable to receive a user input from a driver of the vehicle and download directional information from an external service provider to the control in response to the user input and an initial geographic position of the vehicle (columns 3 and 4), the directional information comprising at least two instructions with each of the at least two instructions being coded or associated with or linked to a respective geographic location (column 4), the control being operable to provide an output corresponding to each of the at least two instructions in response to a current actual geographic position of the vehicle determined by the vehicle-based global positioning system (columns 5 and 6). In column 1, Walker et al recognizes that it may be easier for some people to remember landmarks than the details of a printed map. People

Application/Control Number: 10/645,762

Art Unit: 3661

can become lost despite being given both a reasonable map and written directions on how to following it. According to Walker et al, directions that use objects in the environment that we are likely to notice are more easily followed; for example, "You'll drive for a couple of miles and then pass a bright red farmhouse all by itself; take the first left after that." However, Walker et al does not specifically discloses that the control being operable to provide each instruction only when the then current actual geographic position of the vehicle at least generally corresponds to the particular geographic location associated with each instruction. Kepler, on the other hand, discloses a process and system for the annotation of machine-generated directions with easily recognized landmarks and other relevant information. According to Kepler, once the coordinates of interest are determined, a database is scanned to identify one or more landmarks or establishments within a definable zone about the coordinates. And, once the landmarks or establishments are decided upon, driving directions are generated that incorporate one or more of the landmarks or establishments within the zone in the instructions regarding navigation of the route. See abstract, figures 1, 3 and 6. According to Kepler, the control being operable to provide each instruction only when the then current actual geographic position of the vehicle at least generally corresponds to the particular geographic location associated with each instruction. See columns 5-6 and 8-9. Kepler, like Walker et al, discloses that the control is operable to tag or code each of the instructions with a respective geographic location (i.e., geocode) and is operable to only provide a particular one of the instructions when the respective geographic location tagged or coded to the particular instruction at least generally corresponds to the then current actual geographic

Art Unit: 3661

position of the vehicle. See Walker et al at columns 1 and 2 and Kepler at column 2. Kepler also discloses that each of the at least two downloaded instructions is tagged or coded with or linked to a respective particular geographic location, said control being operable to only display a particular instruction when the respective geographic location tagged or coded or linked to the particular instruction at least generally corresponds to the then current actual geographic position of the vehicle. See columns 3 and 4. According to both Walker et al and Kepler, the user input comprises a vocal input from the driver or occupant of the vehicle to a service center associated with said vehicle-based telematics system. See Walker et al at column 5. The initial geographic position of the vehicle is communicated to the service center via the vehicle-based global positioning system. The at least two instructions are provided by the control as an audible message (Kepler at column 8) or as a visible display (Kepler at figure 1, 3). See also Walker et al at column 8. The visible display comprises at least one of a display on demand display element, a thin film transistor liquid crystal display element, a multi-pixel display element and a multi-icon display element. See Walker et al at column 8. Thus, it would have been obvious to one of ordinary skilled in the art at the time of the invention to be motivated to modify the system of Walker et al by incorporating the features from the system of Kepler because such modification would provide driving instructions or directions that are easier to follow.

3. Claims 8, 10, 11, 15, 18, 19, 23, 27 and 28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Walker et al in view of Kepler as applied to claim1, 12 and 20 above, and further in view of DeLine et al [6,420,975].

Neither Walker et al nor Kepler specifically teaches the interior rearview mirror display and the seat adjustment. DeLine et al, on the other hand, discloses an interior rearview mirror processing system. According to DeLine et al, there is provided a visible display at an interior rearview mirror assembly of the vehicle for use in connection with in-vehicle telematics systems or vehicle-based telematics systems, such as General Motors' ONSTAR. See column 10, 11, 27, and 36. In addition, DeLine et al discloses a seat adjustment system, wherein the seat adjustment system being operable to adjust a seat of the vehicle in response to data received via at least one of a vehicle-based telematics system and a vehicle-based global positioning system in response to biometric data pertaining to the occupant of the seat of the vehicle. See columns 16, 17. Thus, it would have been obvious to one skilled in the art at the time of the invention to be motivated to modify the combination of Walker et al and Kepler by incorporating the features from the interior rearview mirror of DeLine et al because such modification would provide a more efficient system.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's 4. disclosure.
